

Flashings, what are all the different types?

Last revised Tuesday, 15 February 2011

After you have ordered a shed, you may notice in the Bill of Materials all of the different flashing types with their own number in the product description. There is an extensive range of flashings used in ShedTech and this list will continue to grow over time.

To actually see what each flashing looks like and their folds/dimensions, there is a *Suggested Flashing Details*

document that you can access through

Help

>

Library

. This is a PDF document that will load in Adobe Reader.

Simply match the type number from the flashing description in the BOM, with the entry in the document.

There are some flashings where you can pick the one you want to use from a range. These flashings can be set as defaults or changed during the design of your quote. You can choose alternate flashings for:

- Corner Flashings
- Above Door Flashings
- Beam Cover Flashings

To set your default flashings use: *Tools > Default Settings > Flashings*.
